1 [Experience reports: testing and fault correction: An analysis of the fault correction process in a large-scale SDL production model](#)

Dolores Zage, Wayne Zage

 May 2003 **Proceedings of the 25th International Conference on Software Engineering**

Publisher: IEEE Computer Society

Full text available: pdf(783.26 KB)

 Additional Information: [full citation](#), [abstract](#), [references](#), [index terms](#)

[Publisher Site](#)

Improvements in the software development process depend on our ability to collect and analyze data drawn from various phases of the development life cycle. Our design metrics research team was presented with a large-scale SDL production model plus the accompanying problem reports that began in the requirements phase of development. The goal of this research was to identify and measure the occurrences of faults and the efficiency of their removal by development phase in order to target software d ...

2 [Poly-logarithmic deterministic fully-dynamic algorithms for connectivity, minimum spanning tree, 2-edge, and biconnectivity](#)

Jacob Holm, Kristian de Lichtenberg, Mikkel Thorup

 July 2001 **Journal of the ACM (JACM)**, Volume 48 Issue 4

Publisher: ACM Press

Full text available: pdf(378.20 KB)

 Additional Information: [full citation](#), [abstract](#), [references](#), [citations](#), [index terms](#)

Deterministic fully dynamic graph algorithms are presented for connectivity, minimum spanning tree, 2-edge connectivity, and biconnectivity. Assuming that we start with no edges in a graph with n vertices, the amortized operation costs are $O(\log^2 n)$ for connectivity, $O(\log^4 n)$ for minimum spanning forest, 2-edge connectivity, and $O(\log^5 n)$ biconnectivity.

Keywords: 2-edge connectivity, Biconnectivity, connectivity, dynamic graph algorithms, minimum spanning tree
